

Figure4

This is using the matrix of correlated residuals

```
library('knitr')
```

```
## Warning: package 'knitr' was built under R version 3.2.5
```

```
library('rmeta')
```

```
## Loading required package: grid
```

```
#knitr::opts_chunk$set(cache=TRUE)  
#opts_chunk$set(fig.path = "/Users/sarahurbut/Dropbox/PaperEdits/Paper/Figures/")
```

In this file, we make the metaplots demonstrating the original effects and the posterior estimates.

Our first example is MCPH1: original estimates and then posteriors:

```
###  
three.ex.3=which(rownames(z.stat)=="ENSG00000249898.3_8_6521432_T_C_b37")  
newfunc.2(three.ex.3)
```

```
whole.blood.spec=which(rowSums(pm.beta.norm[, -44]<0.5)==43&(rowSums(lfsr[, 1:44]<0.05)>=40))
```

FLJ13114

```
###
five.ex=which(rownames(z.stat)== "ENSG00000120029.8_10_103924251_G_A_b37")
testes.spec=which(rowSums(pm.beta.norm[, -40]<0.5)==43&(rowSums(lfsr[, 1:44]<0.05)>=40))[1:10]

newfunc.2(five.ex)
```

```
###
wholebloodfour=(which(rownames(z.stat)== "ENSG00000017797.7_18_9488704_C_T_b37"))
newfunc.2(wholebloodfour)
```
